Math

- w_{ik}^I is the weight going from neuron i in layer l-1 to the neuron k in layer l
- \triangleright b_k^l is the bias of neuron k in layer l
- ▶ The activation a_k^l of neuron k in layer l is:

$$a_k^I = W_{\bullet,k}^I \cdot y^{I-1} + b_k^I$$

▶ The output y_k^I of neuron k in layer I is

$$y_k^I = f(a_k^I)$$

▶ The input to the neural network is denoted as y^0

Math

With $a^{l+1} = W^{l+1} \cdot f(a^l) + b^{l+1}$

$$\frac{\partial L}{\partial a_k^l} = \frac{\partial L}{\partial a^{l+1}} \cdot \frac{\partial a^{l+1}}{\partial a_k^l} = \frac{\partial L}{\partial a^{l+1}} \cdot W_{k,\bullet}^{l+1} f'(a_k^l)$$

For a random variable X we have:

$$\mathbb{V}[X] = \mathbb{E}[X^2] - \mathbb{E}[X]^2$$

$$\sigma(X) = \sqrt{\mathbb{V}[X]}$$

▶ If X has zero mean then:

$$\mathbb{V}[X] = \mathbb{E}[X^2]$$

(This is the most important formula for this presentation, lets call it bert)

- Problems with a bad initialization
 - ▶ Values might explode or vanish in the first forward pass
 - Gradients might vanish or explode in the first backward pass
- ► This leads to slow or no convergence

- Lets make a few assumptions for Glorot to work
 - ► The activation is point symmetric around 0 and preserves variance around 0
 - 1 Tanh
 - 2 Does **not** work for sigmoid!
 - All w_{ik}^I are independent and indentically distributed (iid)
 - \triangleright w_{ik}^I has zero mean
 - \triangleright b^{I} are initialized as 0
 - \triangleright y^{l-1} and w^l are independent
 - \triangleright y^0 are iid with a mean of 0 and a Variance of 1
- What we want: Variance of activations and gradients of activations should be the same for all layers
- What we need: Variance for weight initialization that can achieve this equality

- $\triangleright \mathbb{V}[y^0],$
 - y^0 is a random Variable e.g. $y_k^0 \sim \mathcal{N}(0,1)$
 - Since all y_k^0 have the same Variance, $\mathbb{V}[y^0]$ can be represented by a single value: $\mathbb{V}[y^0] \cong \mathbb{V}[y_1^0] = \mathbb{V}[y_2^0] = ...$
- $\triangleright \mathbb{V}[w']$
 - w¹ is a random Variable sampled from the initialization distribution
 - Again a single value due to the iid. assumption
 - Is what we try to compute
- $ightharpoonup \mathbb{V}[a']$
 - $ightharpoonup a^l$ is a random Variable dependent on y^{l-1} and w^l
 - Can also be represented by a single value since all neurons before that are iid.

► Lets analyse the Variance of the activations. We can look at a single (the first) neuron

$$\mathbb{V}[a^{l}] = \mathbb{V}[\sum_{i=0}^{n^{l-1}} w_{i,1}^{l} \cdot y^{l-1} + b_{1}^{l}] = \mathbb{V}[\sum_{i=0}^{n^{l-1}} w_{i,1}^{l} \cdot y_{i}^{l-1}] =$$

$$n^{l-1} \cdot \mathbb{V}[w^{l} \cdot y^{l-1}] = n^{l-1} \cdot \mathbb{V}[w^{l}] \cdot \mathbb{E}[(y^{l-1})^{2}]$$

ightharpoonup Lets analyse the expected value of y^I

$$\mathbb{E}[y^{l}] = \mathbb{E}[f(\sum_{i=0}^{n^{l-1}} w_{i,1}^{l} y_{i}^{l-1} + b_{1}^{l})] \stackrel{\text{(1)}}{=} \mathbb{E}[\sum_{i=0}^{n^{l-1}} w_{i,1}^{l} y_{i}^{l-1} + b_{1}^{l}] \stackrel{\text{(2)}}{=}$$

$$\sum_{i=0}^{n^{l-1}} \mathbb{E}[w_{i,1}^{l} y_{i}^{l-1}] \stackrel{\text{(3)}}{=} \sum_{i=0}^{n^{l-1}} \mathbb{E}[w_{i,1}^{l}] \mathbb{E}[y_{i}^{l-1}] = 0$$

- (1) Because f is symmetric and $w_{i,1}^l y_i^{l-1}$ is zero mean and symmetric
- (2) Due to the linearity of \mathbb{E} and $b^l = 0$
- (3) Because w^l and y^{l-1} are independent

▶ With the knowledge that $\mathbb{E}[y^I] = 0$ for all I we can write $\mathbb{V}[a^I]$ as:

$$\mathbb{V}[a'] = n^{l-1} \cdot \mathbb{V}[w'] \cdot \mathbb{E}[(y^{l-1})^2] =$$

$$n^{l-1}\cdot \mathbb{V}[w^l]\cdot \mathbb{V}[(y^{l-1})]\stackrel{(1)}{pprox} n^{l-1}\cdot \mathbb{V}[w^l]\cdot \mathbb{V}[(a^{l-1})]$$

- (1) Activation function should be variance preserving
- ▶ And by iteratively applying the formula:

$$\mathbb{V}[a'] = \mathbb{V}[y^0] \prod_{i=1}^{l} n^{i-1} \cdot \mathbb{V}[w^i]$$

 Lets look at the variance of the gradient (again looking at a single neuron is enough)

$$\mathbb{V}[\frac{\partial L}{\partial a^l}] = \mathbb{V}[\frac{\partial L}{\partial a^{l+1}} \cdot w_{1,\bullet}^{l+1} f'(a_1^l)] \approx \mathbb{V}[\frac{\partial L}{\partial a^{l+1}} \cdot w_{1,\bullet}^{l+1}] \stackrel{?}{=}$$

$$n^{l+1}\mathbb{V}\left[\frac{\partial L}{\partial a^{l+1}}\right]\cdot (\mathbb{V}[w^{l+1}] + \mathbb{E}[w^{l+1}]^2) = n^{l+1}\mathbb{V}\left[\frac{\partial L}{\partial a^{l+1}}\right]\cdot \mathbb{V}[w^{l+1}]$$

► For a Network of length *L* we have:

$$\mathbb{V}\left[\frac{\partial L}{\partial a^{l}}\right] = \mathbb{V}\left[\frac{\partial L}{\partial a^{L}}\right] \prod_{i=l+1}^{L} n^{i} \cdot \mathbb{V}[w^{i}]$$

For the forward pass we would like to have:

$$\mathbb{V}[a^i] = \mathbb{V}[a^k] \quad \forall (i, k)$$

► From

$$\mathbb{V}[a'] = \mathbb{V}[y^0] \prod_{i=1}^{I} n^{i-1} \cdot \mathbb{V}[w^i]$$

We can see that

$$n^{l-1}\mathbb{V}[w^l] = 1 \quad \forall l$$

So a good choice would be:

$$\mathbb{V}[w'] = \frac{1}{n'-1}$$

For the backward pass we would like to have:

$$\mathbb{V}\left[\frac{\partial L}{\partial a^{i}}\right] = \mathbb{V}\left[\frac{\partial L}{\partial a^{k}}\right] \quad \forall (i, k)$$

► From

$$\mathbb{V}\left[\frac{\partial L}{\partial a^{l}}\right] = \mathbb{V}\left[\frac{\partial L}{\partial a^{l}}\right] \prod_{i=l+1}^{L} n^{i} \cdot \mathbb{V}[w^{i}]$$

▶ We can see that

$$n^{\prime}\mathbb{V}[w^{\prime}] = 1 \quad \forall \prime$$

► So a good choice would be:

$$\mathbb{V}[w'] = \frac{1}{n'}$$

So in total we want:

$$\mathbb{V}[w'] = \frac{1}{n^{l-1}} \quad \wedge \quad \mathbb{V}[w'] = \frac{1}{n^l}$$

A middle ground would be:

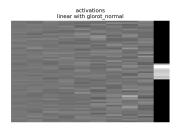

$$\mathbb{V}[w'] = \frac{2}{n'^{-1} + n'}$$

Or as a distribution:

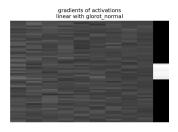

$$w' \sim \mathcal{N}(0, \sqrt{\frac{2}{n'-1 + n'}})$$
 $w' \sim \mathcal{U}(-\sqrt{\frac{6}{n'-1 + n'}}, \sqrt{\frac{6}{n'-1 + n'}})$

 $ightharpoonup n^{l-1}$ is also known as **fan_in** and is the size of the input of a layer, n^l is also known as **fan_out** and is the size of a layer

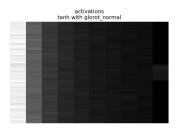

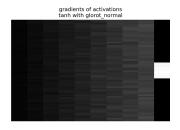

(a) variance of activations

(b) variance of gradients of activations

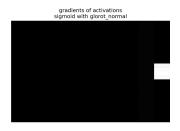

(c) variance of activations

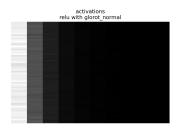

(d) variance of gradients of activations

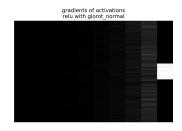

(e) variance of activations

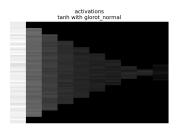

(f) variance of gradients of activations

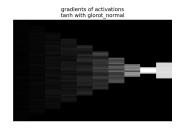

(g) variance of activations

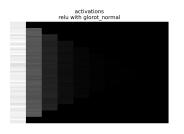

(h) variance of gradients of activations

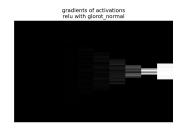

(i) variance of activations

(j) variance of gradients of activations

(k) variance of activations

(I) variance of gradients of activations

(m) variance of activations

(n) variance of gradients of activations

- Assuming that f is linear around 0 is a strong assumption and not neccessarily true. We want to find a good initialization for relu activation.
- Lets revisit our old formula

$$\mathbb{V}[a'] = n'^{-1} \cdot \mathbb{V}[w'] \cdot \mathbb{E}[(y'^{-1})^2]$$

 $ightharpoonup \mathbb{E}[(y^{l-1})]$ is usually not 0. So we have to find another solution.

▶ We assume that a^I is symmetrically distributed around 0. For any layer I:

$$\mathbb{E}[(y')^2] = \mathbb{E}[f(a')^2] = \mathbb{E}[\max(0, a')^2]$$

$$= \int_{-\infty}^{\infty} \max(0, x)^2 p_{a'}(x) dx = \int_{-\infty}^{0} 0^2 p_{a'}(x) dx + \int_{0}^{\infty} x^2 p_{a'}(x) dx$$

$$= \int_0^\infty x^2 p_{a'}(x) dx \stackrel{\text{(1)}}{=} \frac{1}{2} \int_{-\infty}^\infty x^2 p_{a'}(x) dx = \frac{1}{2} \mathbb{E}[(a')^2] \stackrel{\text{(2)}}{=} \frac{1}{2} \mathbb{V}[a']$$

- (1) Because p_{a^l} is symmetrical around 0 and $x^2 \ge 0$
- (2) Because $\frac{1}{2}\mathbb{E}[a^l]^2 = 0$

So in total we get:

$$\mathbb{V}[a^l] = n^{l-1} \cdot \mathbb{V}[w^l] \cdot \frac{1}{2} \mathbb{V}[a^{l-1}]$$

So in order to keep the variance of the activations in the forward pass:

$$w^{l} \sim \mathcal{N}(0, \sqrt{\frac{2}{n^{l-1}}})$$

Or more generally:

$$w' \sim \mathcal{N}(0, \frac{gain}{\sqrt{fan_in}})$$

▶ The gain for relu is $\sqrt{2}$

Lets calculate the gain for leaky relu with slope s < 1:

$$\mathbb{E}[(y^{I})^{2}] = \mathbb{E}[f(a^{I})^{2}] = \mathbb{E}[\max(s \cdot a^{I}, a^{I})^{2}] =$$

$$\int_{-\infty}^{\infty} \max(s \cdot a^{I}, x)^{2} p_{a^{I}}(x) dx =$$

$$\int_{-\infty}^{0} (s \cdot a^{I})^{2} p_{a^{I}}(x) dx + \int_{0}^{\infty} (a^{I})^{2} p_{a^{I}}(x) dx$$

$$= \frac{1}{2} \int_{-\infty}^{\infty} (s \cdot a^{I})^{2} p_{a^{I}}(x) dx + \frac{1}{2} \int_{-\infty}^{\infty} (a^{I})^{2} p_{a^{I}}(x) dx = \frac{1}{2} (\mathbb{V}[s \cdot a^{I}] + \mathbb{V}[a^{I}])$$

$$= \frac{1}{2} (s^{2} \cdot \mathbb{V}[a^{I}] + \mathbb{V}[a^{I}]) = \frac{s^{2} + 1}{2} \mathbb{V}[a^{I}]$$

So for leaky relu we have:

$$\mathbb{V}[a'] = n'^{-1} \cdot \mathbb{V}[w'] \cdot \frac{s^2 + 1}{2} \mathbb{V}[a'^{-1}]$$

▶ The desired variance for the weights would be

$$\mathbb{V}[w^I] = \frac{2}{n^{I-1} \cdot (s^2 + 1)}$$

► This results in the gain:

$$\mathit{gain} = \sqrt{\frac{2}{1+s^2}}$$

► Enough math for today!! Just believe me that

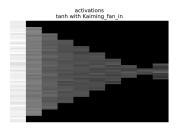

$$w^{I} \sim \mathcal{N}(0, \frac{gain}{\sqrt{fan_out}})$$

preserves the variance of gradients

nonlinearity	gain
Linear / Identity	1
Conv{1,2,3}D	1
Sigmoid	1
Tanh	5 3
ReLU	$\sqrt{2}$
Leaky Relu	$\sqrt{\frac{2}{1 + \text{negative_slope}^2}}$
SELU	$\frac{3}{4}$
